Information Technology | Undergraduate Student

PROFILE

I'm an undergraduate majoring in **Information Technology**, and I'm mostly interested in **software development and cloud engineering**. I like knowing what actually happens behind an app, from the code you see on screen to the servers keeping it online.

I learn best by building something, breaking it, and working out why it broke. Most of what I know came from small projects where I got stuck, looked things up, and eventually got them working.

Right now I'm interested in **cloud infrastructure, web development, backend systems, and automation**. I especially like projects where I can take a rough idea and turn it into something people can really use.

PROJECTS

Cloud-hosted task manager

A full-stack task manager with user accounts, task creation, and status tracking. I built it with **HTML, CSS, JavaScript**, and a **Java** backend, then deployed it on a **cloud virtual machine**. Setting up the server myself taught me more than the coding did, and I added basic input validation and access control along the way.

Automated cloud backup tool

A **Python** script that watches a folder, compresses new files, and uploads them to **cloud storage** on a schedule. It keeps a log and retries failed uploads, so nothing gets lost quietly. It was my first proper experience with a cloud storage API.

Server monitoring dashboard

A small dashboard that tracks **CPU, memory, and disk usage** on a server and shows it as live charts in the browser. Python collects the data, and the front end is **JavaScript, HTML, and CSS**.

Library management system

A **Java** program for managing books, members, and loans, built around object-oriented design with file-based storage. I also rewrote the core logic in **C++** to see how the two languages differ in structure and memory handling.

TOOLS & TECHNOLOGIES

Languages and tools I've worked with include **Python, C++, Java, JavaScript, HTML, CSS, Git and GitHub, VS Code, the Linux command line**, and the basics of cloud platforms such as **virtual machines, storage, and networking**.

STRENGTHS

I'd say **problem-solving and consistency** are my strongest qualities. When something breaks, I'd rather find the real cause than patch over it, even if that takes longer.

I also value **curiosity, independent learning, clear communication, teamwork**, and helping others when I can.

INTERESTS

Outside academics, I like **gaming**, mainly because a good game is just a long series of problems to figure out, and **swimming**, which helps me stay active and clear my head.

> ***"The important thing is not to stop questioning."***
> — Albert Einstein

CURRENT FOCUS

Right now I'm building up my fundamentals in **cloud engineering**: how applications get deployed, scaled, and kept secure. I'm planning a personal project that deploys a web app from start to finish with automated deployment and monitoring, so I can practise this in a real setup instead of just reading about it.
